OBS Calibration Procedure for Generation 3 EFIS products Using software version 2.70 and later

Note 1: This document refers to version 2.70 or later of the EFIS Gen 3 software. It does not apply to any earlier versions.

Note 2: It's always best to use the radio's own calibration first. This procedure only needs to be performed in cases where the radio's own calibration procedures are insufficient.

Note 3: This procedure was written with most analog radios in mind.

Procedure:

1. From the Blue Mountain Command Shell menu select "Command Shell".
2. From the C:> prompt type "obsca1" to get to the OBS calibration page.
3. Towards the upper left there is an OBS window that you may change the OBS values that are sent to the radio. These values will be the same as in the left column in the table underneath. You can change the OBS values using your keyboard arrows.
4. While connected to your radio, cycle through the OBS values and record in the "Radio" column the OBS value that your radio reports for each corresponding OBS preset in the table.
5. Once the table is completed you may use the "ESC" key to exit the program and save.
